Start of a great
new series

Choosing a printer is a lot easier than choosing a computer.

THERE are dozens of quality printers from which to choose. With quality price tags of around £250.

The Brother M-1009, however, breaks all the rules.

Stays defiantly below the £200 barrier.

Though it has far more than its fair share of features, it maintains the extraordinarily low price of £199.95.

Travels at a steady fifty.

In the speed stakes, the M-1009 is certainly no slouch, being fully capable of up to 50 characters per second.

Providing bi-directional and logic seeking printing for normal characters and uni-directional printing for super and sub script and graphics.

Prints on any paper.

Being an impact printer, the M-1009 will print on virtually any paper, including letter headings, invoices and standard office stationery.

It will even print two copies together with your original.

A superb character recommendation.

In its price range, the M-1009 has a great deal more character than many printers.

96 no less, plus international type and graphic characters.

Reliability comes as standard.

Built to the same exacting standards as Brother's elite office

printers, the Brother M-1009 already has faultless credentials for reliability.

Its 9 pin dot matrix head, for example, has an astonishing 20 million character service life.

One printer that doesn't block out the light.

Many home computers tend to be a little on the large side.

In contrast, the compact M-1009, at only 7 cm high, keeps a discreet profile.

Well designed, reliable — and conscientious.

The Brother M-1009.

The future at your fingertips.

How to teach your Micro a thing or two

Thousands of home computer owners have yet to discover their microcomputer's potential to help with many of the problems and decisions that come up every day in the home or office.

Perhaps you have always promised yourself that you would teach yourself programming, but have been put off by manuals which seem to assume a lifetime spent studying computer science and mathematics. Maybe you have looked at other computer books, but have yet to find one which is free of unnecessary jargon or where the program examples bear some relevance to real life and not space invaders.

Relax, your search is over.

The 'Learn BASIC' tutorials from Logic 3 are the latest development of a teaching method pioneered by Professor Andrew Colin and perfected

by testing on 3 generations of students at Strathclyde University. The 'Strathclyde Method' has been translated into 8 languages and used by over 300,000 microcomputer users.

'Learn BASIC' is a jargon free, step by step, course in computer programming, which explains everything clearly in English, not computer talk. In a matter of hours you will be writing your first programs.

'Learn BASIC' is designed for people who want to keep abreast of the computer age, for people who realise that understanding computers is a key to future success at work, at school, and as a parent.

Get 'Learn BASIC' and teach your micro how to be useful! (Available from major branches of W.H. Smiths, Boots, Laskys, Greens, John Menzies and better computer shops nationwide.)

electron user NEWS

CLAIRE WAS SHOW STAR

TINY two years old Claire Hirst became a child celebrity overnight after she opened the latest Electron and BBC Micro User Show in Westminster.

Although Claire cannot read or write yet, she is already a child prodigy on the computer.

National newspapers, television and radio all converged on the New Horticultural Hall to watch Claire go through her paces.

And she duly obliged by demonstrating how she had written a tune on the micro and even designed a Christmas card for her mummy.

'Reliable Electron' report under fire

A REPORT claiming the Electron is the most reliable micro available in the UK has come under fire.

Critics were quick to cast doubt on the findings after it was learned that Acorn has strong links with the publishing house that commissioned the survey.

However Acorn has strongly defended the results, which reveal

that the failure rate for the Electron – based on faulty machines returned to dealers – is only four per cent.

"The survey is as reliable as it could be", an Acorn spokesman told *Electron User*. "It's just a pity that some people are trying to suggest it is biased".

It wasn't what the report stated about Acorn products which has caused the attack –

but the way it slammed other leading micro manufacturers.

The survey roasted Commodore for its "high failure rate", claiming 18 per cent of Vic 20s and 13 per cent of Commodore 64s are returned to dealers.

But it was Sinclair Research which was named as 'the worst culprit'. According to retailers interviewed, more than a quarter of

all Spectrums sold are returned.

And it was Sinclair, understandably smarting under the criticism, who spearheaded the counter attack.

"We reckon the true return rate is about half the figure given in this survey and 40 per cent of these are in no way faulty", said a Sinclair spokesman.

"And we are not very happy about the manner

in which this survey was conducted. It appears that a number of retail store managers were simply telephoned and quizzed on home micro return rates.

"We also believe that the survey was carried out on behalf of a company in which Chris Curry has an interest".

The survey was commissioned by Venture

DISC DRIVE BATTLE IS JOINED

NOW that the Electron has come of age, the stage is being set for a battle of the disc drives.

Developments by Acorn and Cumana have pushed the machine into the league of systems costing hundreds of pounds more and opened the doors for users to create sophisticated databases.

The products that have dramatically boosted the Electron's capabilities and appeal are a 3½in disc interface and drive from Acorn and a range of 5¼ and 3½in disc drives complete with interface from Cumana.

Electron users got their first hands-on

experience of Acorn's new Plus 3 at the Electron and BBC Micro User Show in December when it was demonstrated using the Acornsoft database program.

The Plus 3 provides Electron users with a faster and more flexible alternative to cassettes for the storage of programs and data.

It comprises a self-contained disc interface and 3½in single-sided drive and offers 300K of storage.

A new Acorn advanced disc filing system – described by critics as better than that available for the BBC – provides facilities at the basic level, but also has features equipping it for business use.

The Plus 3 costs £229.

Cumana is supplying its full range of disc drives complete with interface for use with the Electron.

The interface costs £149.95. The 100K 3½in drive – including the interface – costs £299.95, and the 100K 5¼in drive with interface costs £289.95.

Row over Electron survey

From Page 5

UK, a magazine run by Redwood Publishing, a company in which Acorn's managing director Chris Curry and Chris Ward, an Acorn non-executive director, both have substantial interests.

"But no matter who called for the report in the first place, we still insist that it is as accurate as any other similar survey would be", said the Acorn spokesman.

"The results for the Acorn products were almost identical to ones we've had from our own internal studies. So that satisfies us as to its validity".

ACORNsoft believes it can radically influence the development of education in the home with its new range of what it calls "learning environment" software.

The first four titles – Workshop, ABC, Talk-Back and Spooky Manor – are said to go beyond

Acorn's Plus 3 disc drive

Joysticks snag ironed out

SOFTWARE publisher Micro Power has announced a major breakthrough for Electron users.

It has solved the problem of the joystick games that won't run while the Plus 1 add-on is fitted. This snag was first pointed out in the August issue of *Electron User*.

Now Micro Power has written a remedial routine. You load it, pick

out which game you want to play from the resulting menu – and then load the game as usual.

According to Chris Payne, Micro Power's marketing chief, this works for 20 of their 22 Electron games.

And, says Payne, with a bit of trial and

error most other publishers' games will run too.

A define option on the menu lets you enter information about which keys do what on your particular game – up, down, fire and so on.

Best news of all for readers is that *Electron User* will shortly publish a listing of the Micro Power routine.

Meanwhile Micro Power – which has been getting 20 or 30 phone calls a week from baffled joystick fans – is considering releasing the routine on a cassette.

"We don't want to charge money for it", says Payne, "just a small sum to cover our costs".

Warp drive is go

A BUG in *Elite*, the best-selling game from Acornsoft, is about to be ironed out.

The trouble came to light when the Electron version was released. Electron users found they could not go from one galaxy to another in

hyperdrive as is possible in the BBC game.

"We are working flat out to repair the omission", said a spokesman for Acornsoft.

"People who bought the earlier version will be offered a replacement".

Extending range of education

the limitations of school curricula.

Don Clark, head of Acornsoft's home education division, said: "The programs create opportunities for learning, rather than setting up exercises with narrow, pre-determined goals.

"Through them users can explore, experiment, solve problems, even set their own challenges – all essential tasks in real life.

"Our programs are also fun to use, though not mere games. Enjoyment is important in home education

because the traditional motivations of the classroom – teachers and exams – don't exist.

"We have found that if adults find programs boring, so will children. We have designed our programs for everybody.

"They make home learning a group activity".

American operation takes a £6m blow

A DRAMATIC cutback of Acorn's operations in the United States appears to have finally killed off any plans the company had to launch an American version of the Electron.

Acorn has announced it is to reduce its US

presence by 80 per cent following poor sales.

This will have cost the company about £6 million as a result of failing in its bid to capture a major share of the educational market States-side with the BBC Micro.

This means there is even less hope of the Electron securing a foothold in the highly competitive American domestic marketplace.

An American version of the Electron was first mooted in The Acorn Guide to The Electron —

a Penguin publication.

In this the authors, Neil and Pat Cryer, make numerous references to an Electron being built for the United States market.

"Electrons built for the United States have different characteristics from those built for the United Kingdom", they wrote in one section.

However when contacted by *Electron User*, the official spokesman for Acorn claimed to be totally in the dark about an Electron for the States.

"There's no such machine as far as we are aware", he said.

Further enquiries at Acorn unearthed a technical man who had heard "rumours" of such a machine but insisted that it never left the drawing board.

"Unless there's a mole working away on one here at Acorn, I'm sure it never went further than the idea stage", he confided.

But what about the references to it in the Acorn Guide?

"I think it may well have been a case of pre-guessing on the part of the authors..."

Add-on puts on the brakes

A GADGET that can put the brake on the fastest Electron game has been launched by Cambridge Computing Research.

Called the Slomo, it has a variable speed control and can slow down or even stop everything on the screen.

As well as allowing the user to cheat at games — building up amazing scores — it is useful for small children or handicapped people who cannot cope with high speeds.

Games writers can use Slomo to debug their programs, and it could also be used when taking screen photos or by people who just want to figure out how games work.

Says marketing manager Linda Tippey: "The gadget fits on the back of the Electron, extending the expansion bus, so you can still add a joystick."

"We have had lots of interest from the educational field, especially from the lower level and special schools".

SHARE PRICE TUMBLES

FOLLOWING reports of Acorn's massive cutback in the USA, the company's share price slipped to one third of its previous high on the Unlisted Securities Market.

A spokesman admitted that Acorn had scaled down its US operation by four fifths

after fierce competition from native companies.

But he denied that share prices had been influenced by this.

"There are two reasons for the drop", he said.

"One is that US sales of home micros have been declining, and consequently investors think

it will happen over here next.

"The other is that they have the idea all companies on the USM will double their size every year. But as Acorn is easily the biggest company on the USM, it is much less likely to show exponential growth".

NEW RECORDER GOES ON SHOW

MAKING its bow at the latest Electron and BBC Micro User Show was Acorn's new data recorder for the Electron.

The controls feature a full six key mechanism giving fast forward, rewind, play, record, pause and stop. The cue and

review facility enables rapid searching of the tape.

The three digit tape counter is a further aid.

It is battery or mains operated and comes with the necessary leads and mains adapter.

Price: £35.

Part 13 of PETE BIBBY's introduction to programming

YOU may have noticed that so far all the programs we have had in this series have started at the beginning and go on, line by line, to the end.

Occasionally we've sent the program whirling round a loop, but always the result was the same. They progressed relentlessly, obeying every line completely.

While programs that work this way have the benefit that they are easy to debug, they are a bit rigid. They can't make decisions, they just obey orders.

Wouldn't it be nice if there was a way that we could have a program that took decisions for us? We could have programs that could vary what they do in line with the data you give them.

This means that instead of just following the line numbers, what the program does depends on what information it is given.

Happily for Electron users there is a Basic structure that allows programs to take decisions for themselves and act according to circumstances.

This is the IF...THEN statement. Program I shows it in action.

Run it a couple of times and see what happens. You can press any letter key you want, but you only get a message if you press capital Y.

```
10 REM PROGRAM I
20 INPUT "Press a key "
key$
30 IF key$="Y" THEN PRINT
T "You pressed the Y key."
```

Program I

Line 20 just asks you to press a key and, when you hit the Return key, it stores the result in the string variable `key$`.

The work is done in line 30 which reads almost exactly like a line of English. It looks at `key$` and if it contains (or is equal to) Y then the Electron prints the message.

Notice that only IF the condition is true THEN the Electron goes onto processing

IF conditions are right THEN your programs can make decisions

Now your programming skills
are really starting to develop

the rest of the line.

If you run the program again and press, say, T you'll find that you get no message, just the prompt to tell you that the program has ended and the Electron is waiting for something to do. Not very exciting, is it?

What's happened is that line 20 has stored T in `key$`. Line 30 checks to see if the variable `key$` is the same as Y.

In this case it isn't, so the condition is false and the rest of the line is ignored. No message is printed.

The Electron now looks for the next line, finds that there isn't one and so the program stops.

The rule is that IF the condition is true THEN the rest of the line is obeyed. IF the condition isn't true THEN the rest of the line is ignored and the Electron goes onto the next line if there is one.

The trouble with Program I is that if you pressed Y instead of Y you didn't get the message. You know that Y and y both mean the same thing, but to the Electron they're very different. Program II checks for both y and Y.

Here line 30 checks for Y then line 40 checks for y. The message only gets printed if one of the conditions is true.

If neither y nor Y have been pressed, neither condition is true and so no message appears.

```
10 REM PROGRAM II
20 INPUT "Press a key "
key$
30 IF key$="Y" THEN PRINT
T "You pressed the Y key."
40 IF key$="y" THEN PRINT
T "You pressed the y key."
```

Program II

As you might imagine, you could use lots of these one after another to check various conditions but it might get a bit long-winded.

Program III shows that numeric variables can be used in conditions as well as the string variables we've used previously.

```
10 REM PROGRAM III
20 FOR loop=1 TO 5
30 READ x
40 IF x = 5 THEN PRINT "
x is 5"
50 NEXT loop
60 DATA 1.5,6.5,3
```

Program III

Here the FOR...NEXT loop cycles five times, each time reading a value from the data statements into the variable `x`. This means that `x` will be 1 the first time round, 5 the second time round and so on.

Line 40 contains the conditional part of the program. Each time a new value of `x` is read it checks to see if it is equal to five. If it is it prints the

message, if it isn't it just ignores the rest of that line.

As `x` has the value 5 on two occasions two messages are printed.

The next program uses exactly the same condition but this time it doesn't print out a message. It keeps a running total of how many times `x` has been equal to 5.

```
10 REM PROGRAM IV
20 count=0
30 FOR loop=1 TO 5
40 READ x
50 IF x = 5 THEN count=count+1
60 NEXT loop
70 PRINT "The condition
is true 'count' times."
80 DATA 1.5,6.5,3
```

Program IV

The difference lies in line 50. Here the IF condition is the same, it's the rest of the line after the THEN that has changed.

What happens now is that IF `x` has the value 5 THEN one is added to the variable `count`.

In this way `count` keeps track of the number of times the condition has been met. As you'll see if you think about it, this is more useful than just printing messages.

To recap on what we've covered so far we can use an IF...THEN statement to make the Electron choose between alternatives.

If a condition is met THEN the program will do one thing otherwise it will go onto the next line and do something else.

This is the sort of logic behind such questions as "Do you want another go?" and "Which skill level?" that you find in games. What the program does depends on what you reply.

So far the only condition we've met is one using the equals sign.

Program IV counted the number of times `x` was equal to 5. Is there some way that we could make it keep track of the number of times that `x` was not equal to 5? Program V shows how it's done.

```

10 REM PROGRAM V
20 count=0
30 FOR loop=1 TO 5
40 READ x
50 IF x < 5 THEN count=
count+1
60 NEXT loop
70 PRINT "The condition
is true ;count; times."
80 PRINT "This means tha
t ;count; of the numbers
are not equal to 5"
90 DATA 1,5,6,5,3

```

Program V

Line 50 looks very much the same as before. It has a condition beginning with an IF and a THEN followed by

count=count+1

The difference is that this time the condition is

x < 5

instead of the

'x=5

we had before.

Don't be worried by the <> sign. All it means is "not equal to". This means that line 50 reads "if x is not equal to 5, then add 1 to the value of count".

The IF... THEN works in exactly the same way, only adding one to count when the condition is true, that is, when x is anything but 5.

What if we wanted to count the number of times that x is less than 5? Program VI shows how it's done.

```

10 REM PROGRAM VI
20 count=0
30 FOR loop=1 TO 5
40 READ x
50 IF x < 5 THEN count=co
unt+1
60 NEXT loop
70 PRINT "The condition
is true ;count; times."
80 PRINT "This means tha
t x is less than 5 on ;cou
nt; occasions."
90 DATA 1,5,6,5,3

```

Program VI

Once again we've introduced a new symbol into our condition. Don't let it worry you, all < means is "less than".

(I remember it because < is almost like an L.)

Since x is less than 5 on two occasions the final value of count in Program VI is two.

You might guess that if we can test for a "less than" condition being true we can also test for a "more than" condition. Line 50 of Program VII shows how this is done.

```

10 REM PROGRAM VII
20 count=0
30 FOR loop=1 TO 5
40 READ x
50 IF x > 5 THEN count=co
unt+1
60 NEXT loop
70 PRINT "The condition
is true ;count; times."
80 PRINT "This means tha
t x is greater than 5 on ;c
ount; occasions."
90 DATA 1,5,6,5,3

```

Program VII

As you'll no doubt have guessed, > is short for "greater than". Line 50 now adds one to count for every time that x exceeds 5.

And we needn't stop there. Suppose we want to keep track of the number of times that x is either greater than or equal to five.

Obviously we could add together the results from Program IV (the number of times x is equal to 5) and Program VII (the number of times it's greater than 5).

There is, however, an easier way as shown in Program VIII.

```

10 REM PROGRAM VIII
20 count=0
30 FOR loop=1 TO 5
40 READ x
50 IF x >= 5 THEN count=
count+1
60 NEXT loop
70 PRINT "The condition
is true ;count; times."
80 PRINT "This means tha
t x is either bigger than o
r equal to 5 on ;count; o
ccasions."
90 DATA 1,5,6,5,3

```

Program VIII

It will come as no surprise to learn that >= means "either greater than or equal to". And, of course, there is the mirror-image condition which is used in Program IX.

```

10 REM PROGRAM IX
20 count=0
30 FOR loop=1 TO 5
40 READ x
50 IF x (<= 5 THEN count=
count+1
60 NEXT loop
70 PRINT "The condition
is true ;count; times."
80 PRINT "This means tha
t x is either less than or
equal to 5 on ;count; occ
asions."
90 DATA 1,5,6,5,3

```

Program IX

Here <= means "either less than or equal to". What it means is that when x has a value that is either equal to or less than 5, line 50 adds increments count.

Don't let all these different logical operators (as they are known in polite society) worry you.

I've summed them all up in Table I. At first they may be a little intimidating, but after a bit of practice you'll find they become second nature.

Vary the DATA statements

in Programs IV to IX and see if you can understand the results.

Bear in mind that it doesn't matter what logical operator is in use in an IF... THEN statement. As long as the condition is true, the rest of the line after then THEN is obeyed. If it isn't true everything after the THEN is ignored.

And that's it for this month. Have fun playing around with IF... THEN statements and when you think you've mastered them try Program X for size. Try changing the DATA statements and see what happens.

```

10 REM PROGRAM X
20 count=0
30 FOR loop=1 TO 5
40 READ x
50 IF x (< 2 OR x > 5) THEN
count=count+1
60 NEXT loop
70 IF count < 3 THEN PRIN
T "The condition is true ";
count; times." ELSE PRINT
"The condition is false ";(
5-count); times
90 DATA 1,5,6,5,3

```

Program X

● If you want to know more about conditionals THEN don't miss next month's article.

Operator	Meaning
=	equals
<	less than
>	greater than
<>	not equal to
<=	less than or equal to
>=	greater than or equal to

Table I: Logical operators

REWRITE THE HIGH SCORE TABLES

So, you've got an Electron. You've also got enemies. With the Gunshot, you'll have all the opposition cowering in corners. 8-directional action and an all-in-one moulded stem allows accurate annihilation and strength to survive those all-night sessions. Dual fire buttons for fading fingers (and a rapid fire version when they're really coming thick and fast). And, if you break it (and we know you'll try) our 12-month guarantee will prove invaluable. Only £8.95.

For the Gunshot, Vulcan's totally hardware Electron interface comes with a free tape which converts all keyboard software for joystick use. And it'll allow you to destroy BBC game enemies on your Electron, too! £19.95, 12-month guarantee

See the range of Vulcan joysticks and interfaces at your local stockist ... we'll see you on the high score tables.

VULCAN
ELECTRONICS LTD
Joystick Genius

200 BRENT STREET HENDON NW4 1BH TEL: 01-203 6366

THIS is the first of a short series of articles which will show how to achieve simple but effective animation on the Electron using only the Basic language.

As must be expected, no great speed is achieved. The intent is merely to introduce the reader to the basic techniques (no pun intended) and hopefully to foster an interest in things graphical.

The first technique we'll cover is text and character animation. This is probably the simplest method both to understand and to programme.

Smooth movement of text can be achieved by careful positioning of text using the PRINT and TAB(X,Y) commands.

Program I shows this technique moving one word around the screen.

The only important thing to remember is to erase the word at the last position before

Animated Electron

An introduction to things graphical by ALAN PLUME

writing it at the next. Obviously you can use this method to move portions of text around the screen in almost any direction that you choose.

The next example, Program II, shows that with a little effort and using a tiny bit of graphics, the method above can be built upon.

Line 40 redefines character number 224 to be an "i" without the dot. Then using MOVE and the relative PLOT commands a "dot" (in fact two dots) can be moved down to

dot the "i". Lines 60 to 110 use the technique outlined above of displaying and then erasing to give the impression of movement.

Lines 130 onwards display another piece of text which is printed with a small delay. Once printed the Electron "realises" that the apostrophe is missing. The appropriate section of text is moved to the right and an apostrophe moved in to the gap.

The third and final example shows the use of redefined

characters with the above techniques.

A number of "frames" are formed that, when displayed one after the other, give the impression of smooth movement.

Thirteen characters are defined, once again using the VDU 23 statement familiar from the *Electron User Casting Agency* series.

These are assembled on the screen using VDU 31,X%,Y% to position the characters.

The first frame is displayed for a set time using a delay, then the appropriate parts are overwritten giving frame 2.

This is repeated for frame 3 and the whole sequence is repeated until ESCAPE or BREAK is hit.

Note that frame 1 has a space character (32) in its second line. This is to blank out the upraised arm in frame 3.

LISP, THE LANGUAGE THAT STRIKES LIKE LIGHTNING

LISP, developed around 1960 by John McCarthy and others at the Massachusetts Institute of Technology in America, is one of the oldest computer languages still in use.

His main objective was to produce a powerful language for defining and transforming functions. Lisp was designed to manipulate abstract symbols called atoms and combinations of symbols called lists. It is a LISP Processing language.

Perhaps the most publicised use of Lisp has been in the field of artificial intelligence research. The expressive power of the language was recognised by workers who were wrestling with the difficult symbolic manipulation problems involved.

Programs have been written that hold conversations, write stories for children and summarise text.

Most miniframe computers support Lisp and now a few micros as well. There is no generally accepted standard, so as a result there are many dialects around. However, adapting Lisp to run on another machine is usually straightforward, making the language fairly portable.

Acornsoft's variant is available on cassette or ROM cartridge. The cassette version is the one considered here. The ROM cartridge will have all the facilities offered by the cassette version, plus a few extra, and a lot more memory.

The cassette and manual are sold separately, which seems a little strange. Unless you are already an expert Lisp programmer — and not many people are — then neither is much use without the other. Price of the package is about £23.

Large scale implementations may contain hundreds or even thousands of built-in functions. Consequently a small micro such as the Electron cannot hope to

provide all of them, so only the bare essentials are built into Acornsoft's Lisp.

However this should be sufficient. Fortunately, many of the standard utilities can be written in Lisp itself and appendix B in the manual lists a few of these.

Since many of the functions not provided would only be used occasionally and may have specialised uses, these can be typed in as and when needed for each application.

Acornsoft Lisp has a few extra functions not normally found in other systems. These are to allow the use of the Electron's excellent graphics and sound capabilities.

One of the most powerful is the VDU command which provides an easy interface with the Electron's machine operating system.

Lisp takes about four minutes to load. It has 5.5k of machine code interpreter and 3k of initialised Lisp workspace containing utilities and constants. These can be deleted, if not required, to gain extra memory.

When loading is complete the user is asked to select a mode — either 3, 4, 5 or 6. Once one has been selected it is not possible to change to another using MODE n, so if you want to use graphics or the 80 column mode 3 you must start up in the correct mode.

There are two main ques-

tions to be asked of Lisp:

- What can you do with it?
- How easy is it to use?

Chapter 23 in the manual answers the first question — 11 applications are listed demonstrating its use. The programs are not complete, but do provide the building blocks for constructing much larger Lisp applications, and the user is encouraged to develop them further.

The examples include: Sorting a list into alphabetical order, arbitrary precision arithmetic (how to cope with very large numbers), a Lisp pretty-printer (used to display large pieces of Lisp structure, spreading its output over many lines and using indentation to make it more legible), an animal guessing game (you think of an animal and the Electron has to try and guess it), a route finding program (also on the cassette), graphic displays (how to create pictures), and mazes and dungeons (an adventure game).

The answer to the second question is entirely subjective and everyone will have their own opinion. I have to disagree with the manual which states: "It provides a complete introduction to Lisp and assumes no previous knowledge of the language", and that "Lisp is easy to learn..."

Lisp seems very strange and confusing at first, operating on lists and atoms,

recursion being very common. Unlike Basic, you need to know and understand a large proportion of Lisp before you can even think of writing your first simple program, and this is the main stumbling block.

Lisp operates on the "lightning principle". The concepts strike you suddenly when you are almost ready to give up. Once you have been struck, everything falls into place. Strength, stamina and perseverance are required.

Acornsoft's Lisp is an excellent package for anyone interested in programming and computer languages. It will teach pattern recognition, and recursion will become second nature.

A word of warning though, it is not for the absolute beginner. Be prepared for a struggle, and remember the "lightning principle".

One last note: If you are unsure whether to invest in Lisp, try to get hold of The Little LISPer by Daniel P. Friedman (I borrowed it from the local library).

This is not a manual on how to use Lisp on the BBC or Electron, but it explains the structure, principles and concepts involved in a very simple and amusing manner.

You do not need Lisp or even a computer to understand and appreciate it. Read it. I think you will find Lisp fascinating.

ELECTRON JOYSTICK INTERFACE

Electron users! This is the add-on everyone wants. It's the new Electron switched joystick interface from First Byte - available now with free conversion tape that vastly extends your game range right away.

The interface operates with all 'Atari-style' 9-pin joysticks, and its many advanced design features put it way out in front for quality and reliability. That's why, to date 15 major software houses are already bringing out games that work directly with the First Byte Electron Joystick Interface - and many more are sure to follow.

Look at these advanced design features.

Works with all 'Atari-style' 9-pin joysticks and utilises rapid-fire mode on Quickshot 2

Only 2 chips for ultra-high reliability and low power consumption ensuring safe operation with the Electron.

Custom-built, colour-co-ordinated case in high-impact plastic. Special fittings ensure that when the joystick is plugged in, the case takes the strain, not the soldered joints.

Gold-plated connectors ensure a perfect contact. Metal polarising key and nylon end caps ensure positive locking.

TRIG, as you might guess from its name, is a program to help with trigonometry problems.

Written by GRAHAM HAWKINS it will calculate the length of the sides and the angles of any right angled triangle from a minimum of information with a minimum of fuss.

All the instructions are in the program. So get typing and let your Electron tame those triangles!

Don't be obtuse - get your angles right on!

In any triangle the unknown sides and angles can be calculated provided that at least one side and one angle, OR TWO sides are known.
This program will calculate the unknowns with the minimum of information

Press SPACE to continue.

BOUNCY

Have a ball
with ROLAND
WADDOLOVE's
enjoyable little
game

BOUNCY is a simple but enjoyable game in which you have to trap a ball which is moving around the screen, bouncing off any objects in its way.

Your only control is the space bar, which can be used to place a block just behind the ball.

After practice you should be able to build a

box by tapping the space bar and placing blocks at a selected spot as the ball flies past. When the ball bounces into the box press the space bar to trap it.

There are 25 balls in all and the object of the game is to trap them using as few blocks as possible. The lower your score the better you are.

Full listing starts
on Page 53

PROCEDURES

PROCinitialise	Defines the characters used and sets the best (lowest) score.
PROCscreen	Draws the border, prints best/ball/blocks.
PROCnew_ball	Finds an empty space and prints the ball, sets the vertical and horizontal components of movement.
PROCmove_ball	Moves the ball until it is trapped, calls PROCbounce if there is a block in the way.
PROCbounce	Works out the new direction, uses FNpoint to see if there is a block in the way.
FNpoint	Sees if there is a block in the way.
PROCdelay (T%)	Waits for T% hundredths of a second.

PROCgame_over	Prints your rating, score and high score, sees if you want to play again.
PROCinstructions	Prints the instructions, sets the difficulty level.

VARIABLES

ball	Number of balls.
best	Best (lowest) score.
B%	Number of blocks placed.
I%	Loop counter.
X%,Y%	Coordinates of ball.
V%,H%	Vertical and horizontal components of movement.
E%	Flag to show whether an easy or hard game.
T%	Time delay.
a\$	Rating.

ROGER FROST demonstrates the Electron's design capabilities

SWATCH is one of those programs that amaze you with the range of effects the Electron can produce.

This program of lines and colours automatically turns the pages of a never-ending wallpaper pattern book or a swatch of curtain materials.

The designs vary from plain, bold colours, through Regency stripes and exciting Welsh tweeds to a range which seems to have been lifted directly from the seats of British Rail trains.

It is amazing what can be produced with just horizontal and vertical lines, and it is often hard to believe that only four colours are present on the screen at any one time.

Plan your colour schemes for home decorating, or just sit back and boggle at the versatility of your Electron.

Plan your colour schemes

Now No. 1 BBC
game on Micro deal
Top Fifty chart

YOU can go for gold ...with the

Fancy pitting yourself against the world's best at this summer's Olympics?

You can do so without going anywhere near Los Angeles — with the most challenging package of programs of 1984.

MICRO OLYMPICS is more than a game. It's a brilliantly written collection of ELEVEN track and field events.

And because we know we're going to sell many thousands of them we've brought the price right down — to just £5.95.

Ever imagined yourself as another Seb Coe? Then try to run against the world record holder at 1500 metres. And if that distance is too much for you then there's always the 100, 200, 400 and 800 metres to have a go at.

Not much good at running? Don't worry, MICRO OLYMPICS has many more challenges for you. Why not try your skill at the high jump or the long jump?

And if you can't beat the computer at running or jumping then you can always throw things around in frustration! The trouble is that it's just as hard to be a champion at the discus, the hammer or the javelin.

And the pole vault takes the event to new heights!

Yes, it's fast, furious fun, pitting yourself against the world's best times and distances on your micro.

You may not be another Steve Ovett or Alan Wells, but with practice you COULD become the Micro Olympics Champion!

Also available from WH Smith
and all other leading stores

**Play Micro Olympics
— and let your fingers
do the running!**

THE COLUMN THAT TAKES A LOOK INSIDE THE LATEST RELEASES

Classic Adventure Melbourne House

IT wouldn't really matter how good or bad this program is — as it is the only Electron version of the original Colossal Cave adventure, I'd have to recommend it.

So it comes as a bonus to find that this adaptation is superb.

I haven't played the original Crowther and Woods version so I can't say how close to the original this is. However it seems to have all the problems I have read about so it must be a full — or nearly full — adaptation of the original.

In it you play the part of a typical greedy adventurer. You come hot-footing it, flushed with success from your last adventure. You've heard of the fabulous treasure to be found in the area and are eager to get your share.

Armed with the objects you find above-ground you race off to the grating that gives access to the labyrinth of caves below.

You soon come across your first major obstacle — a large venomous snake. Its teeth soon puncture your ego as well as your skin. It is at this point that you realise that things aren't going to be quite as easy as you thought.

Careful exploration of the earlier locations soon reveals

A cave to conjure with

the solution — though the final answer is for the birds.

You'll also find the first magic word. This returns you to the building but remember to turn off your lamp — it won't last forever.

You progress slowly, solving a maze and other puzzles and finally enter the main body of the adventure. Eventually you will solve the game but it is more likely to take weeks rather than days. Well, what

else can I add? Very few adventures ever reach the standards set by this one.

It is deservedly called Classic. Somehow it is exciting to visit all these locations I have heard so much about before.

In a way it is like a legend coming to life. All I can say is it's a superb game and one that no true adventurer should be without. Magic!

Merrin

Touch too violent?

Swag Program Power

SWAG is a rarity in arcade style games — it is a genuine two player game with the option of the second player being the micro.

The aim is to acquire jewellery to the value of £250,000 by moving your man to randomly placed

jewels and returning with them to your house.

If that sounds easy, then don't forget that your opponent is after the same treasure as you and is quite prepared to shoot you to get it.

You may also have insurance company robots on your trail. Any collision with them means a quick, empty-handed return home.

Of course you have the same advantages as your opponent. There is a different type of robot after him.

Robots can be converted from one kind to another by shooting them or by travelling to a special symbol which occurs on the screen from time to time.

Attempting to keep order in this lawless area are the police. There are three police cars which score points for your opponent if you go near them.

If you shoot one, it relentlessly follows you until you drink a can of beer and shoot it again. You can use that to your advantage by stopping the car near your opponent's home.

With all this shooting you will probably run out of ammunition, but they sell it at the bank, provided you've got gold.

Regrettably, in translating this program from a BBC Micro version, one or two things have been forgotten. The instructions give a most unsuitable group of keys to

Super for stargazers

THIS well written program enables the user to view the stars from any point on the Earth's surface on any date and at any time — all without leaving the comfort of your armchair.

Your monitor can now show a vast array of more than 450 stars in 50 major constellations.

For your part, move the telescope-style display up, down, right or left as well as zooming in and out, all via the

Constellation Superior Software

keyboard.

The well constructed program allows you to view the heavens in two different ways — as you might observe by looking up into the night sky by the varying magnitude of the stars and secondly, the display can be changed to show each constellation by a code of letters.

For example, a group of

letter Gs indicate the position of the constellation Gemini.

Using this letter code all 50 constellations are listed, the accompanying notes giving additional information to the user.

All in all a very good educational package which is simple to use. Amateur astronomers might also like to consider this one if they're fortunate enough to own an Electron.

Ken Smith

From Page 19

player two, but fear not, the actual keys are O (up), L (down), + (left), * (right) and Return (fire).

More seriously, you do not seem able to redefine the keys as you might wish.

The game is provided with many options: sound on or off, or a start for either player.

I personally worry about the glorification of theft and violence. Is this what we really want for our teenagers? The trouble is like so many of these games, it is addictive.

Rog Frost

Beat the busy bees

Pengi
Visions

PENGI type games have become quite popular lately with two or three software houses having their own versions on the market.

The game is derived from Pac-Man, but Visions' Pengi is far superior to any Pac-Man program.

You are in control of a cute little penguin who is trapped in a maze made up of large ice blocks inhabited by snow bees.

The object of the game is to line up three special white ice diamond blocks without being caught by the snow bees.

Fortunately these can be killed by squashing them with an ice block which slides along if you push it.

The graphics are excellent as is the sound, and I found it difficult enough just avoiding the snow bees, never mind lining up the ice diamond blocks.

There is a high score table of famous penguins, on screen scoring, redefinable keys, and a practice mode in which you can't be killed. If you're into arcade games you will love this one.

Roland Waddilove

No loss of power

Jet Power Jack
Micro Power

A COUPLE of months ago I played this game's BBC ver-

sion on the big brother machine and found it fascinating. It is one of those annoying addictive games which Micro Power have the knack of producing.

I was delighted on receiving the Electron version to find that it is identical - no scaled down sound or fewer features, but the full implementation with no perceptible change, not even in speed.

Perhaps I should add that I find the game a little too fast, as I prefer to achieve some degree of success straight away, and my young son also enjoys trying the games out. But we both found the initial action too speedy.

I have tried the BBC version on the Electron and found I was able to accumulate a decent score and develop a strategy.

There are five screens, which may be accessed separately from the menu. If screen 1 is chosen, and you are a better player than I, the other screens are encountered in order.

On each the basic format is the same, with a spaceship on the left needing to be refuelled with fuel which is on the right. Shades of Jet Pac, perhaps, which I enjoyed greatly in my misspent youth on a Sp*ctr*m.

The man is moved across the screen by careful use of the left/right controls, and the hover motor.

There are safe platforms to rest on briefly, but nearly everything else is quite lethal

to Jack. Each screen has different problems, with elements of other games appearing, such as the vertically moving monsters which have the same effect as the lifts in Corporate Climber.

The graphics are good, the smoothness of the movement superb. Sound is fair, and can be turned off if required. The key response is quick, precise and accurate.

I just wish my reactions were!

Phil Taylor

Galactic surprises

Galaxy Wars
Bug Byte Software

ANOTHER game from the Space Invaders camp with a few differences and a couple of surprises.

You are the little destroying machine at the bottom of your screen, moving left to right with your FUNC and Q keys, firing with the Delete key. F freezes the game.

The first screen of alien bombers are in an easy to pick off formation lined across the screen. That is, easy if you get your rhythm right.

However, watch out for the space pods which land on your level and can blow you to smithereens if you run into them.

But there's no time for complacency - as soon as you've fought them off, the H wing fighters appear on the screen. These are both hard to dodge and at times seemingly impossible to blow up.

And, after all this, you have

QUIZ HAS ALL THE ANSWERS

THIS marvellous little package is more than a quiz, more than a game and much more than so many of the educational programs on the market.

High praise you say, but consider what you get for your money.

A choice of 15 quiz topics each containing 50 questions, three different ways of answering - multiple choice, true or false and fill in the missing letters.

Then there's a facility to pass if you're really stuck, a summary of your performance and the chance to re-run the ones you passed or got wrong.

All this under the eyes of

Answer Back
Senior Quiz
Kosmos Software

the micro timekeeper.

Add to that good graphics in the form of craters, planets, space-ships and your friendly robot with his laser gun. Mix in a little sound and you have part two - a game, triggered by correctly answering a question.

A tone sounds, an alien spaceship appears from behind your planet, you hit the robot's laser fire button and try to shoot it down.

It's really compelling stuff.

But wait... there's more to come. Being the mastermind you are it won't take you long to come to grips with the correct answers to most of the 750 questions available.

Therefore create your own. Even this can be done using the program's create, save and verify facility. Now you have a package made for the kids to do their homework with.

You set the questions and they get to shoot down all the nasties from outer space. Peace will reign in your household.

Watch out Magnus Magnusson, your job's in jeopardy.

Ken Smith

to dock with your mother ship to refuel.

All in all it's an exciting game for the arcade addict, with reasonable graphics and good sound effects.

Keith Young

Offers you can refuse

Survivor
MP Software

THE year is 1910 and you're on a cruise of the tropics when there is an accident and the ship sinks. The result is that you find yourself swimming in a shark-infested sea.

Can you survive and find your way back to civilisation, or alternatively find happiness on a tropical island?

There are very few actual puzzles to solve in this adventure. Almost everything is accomplished by choosing between two alternatives - HIDE or STAND, EAT or STARVE, ACCEPT or REFUSE.

The results of these choices can be hilarious. For instance, on entering a village you have to bribe the tribal chief. If you have what he wants he then offers you his daughter's hand in marriage.

If you accept you are given your own hut. You are then given a further choice - STAY or ESCAPE. If you STAY the game ends and presumably, you live happily ever after. If you REFUSE the chief gets angry and swops you with another village for a pig.

Here you are offered some food and, again, you have a choice - EAT or REFUSE. If you REFUSE you become

lunch for the tribe. If you EAT you are imprisoned in a hut and have to steal the witch-doctor's clothes to escape.

You'll also meet Robinson Crusoe who asks you to stay and be his friend. If you accept ... end of game again. There is also a secret civilisation in the depths of the island. If you find them, guess what? Yes, end of game yet again.

I'm not sure I'd call this an adventure as such and I'm sure I didn't manage to find all the endings - how do you get past the rhino?

Overall, a departure from the usual M&P style of adventure but there are so many alternatives in the course of the game for you to choose from; that I'm sure, like me, you'll spend your time discovering the results of all of them. It's an unusual and highly entertaining adventure.

Merlin

Memory monitor

Starmon Machine Code Monitor
Slogger Software

If you've always thought that a monitor was an alternative to the family TV, you may think

that a machine code monitor would be a fast version. In fact Starmon is a piece of software stored on a microchip.

This type of software is sometimes called firmware, and to be able to use it you will need a sideways ROM card to plug into the expansion port at the back of your Electron.

A machine code monitor program like Starmon enables you to look at the contents of the micro's memory, both the 32k of RAM and the other 32k of ROM.

The program is very easily loaded. Just type 'ST' and it's there - instantly.

Once loaded, you may well wonder what to do with it. Well, the clever part of Starmon is that it uses the memory normally occupied by Basic so running Starmon will not interfere with the program in memory.

It is easily possible to study any program - even those unlistable ones. Of course, you do not get a Basic listing. It is the contents of memory you see, but Starmon will do its best for you.

The contents of memory can be displayed in decimal, hexadecimal, binary or even octal. In addition, if Starmon thinks it detects an ASCII character it will print that. It can also disassemble code - that is, it produces a listing in

assembly language.

This all sounds very fearsome, but if you are a beginner to this kind of thing don't be put off, because you can quickly learn some skills.

For example it is very easy to alter the contents of memory without spilling the program, I have personalised halls of fame so that they load with my name.

For the advanced user, Starmon is a very full program. With it you can search memory for bytes or strings, or move chunks of code around from one area of memory to another.

You can block fill memory, write directly to memory locations or alter the 6502 registers. There are also facilities to single step through programs, which can greatly help with debugging, or allow you to learn what machine code instructions do.

It is also possible to dump Starmon screens to a printer for future reference.

Starmon comes with a well written 42 page booklet, which makes the program easy to use. This whole package would be very useful to anybody keen to program, or even just dabble in machine code.

It is a thoroughly professional piece of firmware.

Rog Frost

TIME TO LEARN

What's the Time?
Collins Software

DRAWING and DRAWING of the clock hands seemed to be rather a slow and laborious process.

Hours introduces a little figure called Microman who works through his day to illustrate the passing of hours. There follows a fairly standard kind of test on hours, with appropriate responses from the computer.

Half hours extends this idea, and follows a similar format which again means rather tedious drawing. Quarters starts in the same vein, but then asks the child to move the hands of the clock using

the H and M keys.

Although this was much more meaningful to the youngsters I tried this on, even they showed signs of frustration at the slow rate of action.

Minutes was altogether better, attempting to explain the link between the numbers on the clock face and those curious expressions we use with minutes to or minutes past an hour.

The final part of Minutes asks the child to enter the time, by pressing the hours followed by the minutes.

If only the screen display could be made a little speedier on occasions, this would be a good piece of software for the parent to use at home.

Phil Taylor

As time

CLOCK is an Electron utility program which can be either used on its own or embodied in any program where a readout display of the time is required, such as in a game or a database program.

It starts by asking you to enter which screen mode you want to use to display the time.

Next you are asked to key in the correct time. This should be in a 24 hour format, so that 2.30pm would be entered as 14.30.0.

Pressing Return when the seconds coincide with the correct seconds on your own watch will cause the program to start counting and calculating the time. This means that you can set the time very accurately.

Then you will be asked to

enter the coordinates for the screen display position. These coordinates (X and Y) will dictate where the time is printed. They should be entered as, for example, 10,15 (column 10, line 15).

Note that the screen display position coordinates vary with the mode entered, so the X and Y values should not exceed those shown in Table 1.

After entering the screen coordinates you will be shown

Mode	X values	Y values
0	0-70	0-29
1	0-30	0-29
2	0-12	0-29
3	0-70	0-22
4	0-30	0-29
5	0-12	0-29
6	0-30	0-22

Table 1: Coordinate limits of the seven modes

SLOGGER ADVANCED SYSTEMS

ROMBOX is a sideways ROM extension unit which enables many existing BBC ROM based programs to be run on the BBC or the Electron. Fully compatible with either computer, it is strongly constructed and will also support the Plus 1 on the Electron. ROMBOX is supplied with comprehensive instructions and an inter-connecting cable for the BBC.

BBC £49.95 (including cable)
Electron £39.50

STARMON is the only machine code monitor for the Electron and provides a powerful and easy to use command repertoire for advanced debugging and machine code programming. A ROM extension unit is required when used with the Electron. STARMON is also available for the BBC and both versions are supplied with a comprehensive and easy to follow User Manual.

BBC £27.50
Electron £22.50

All prices include V.A.T.
and postage and packing
within the U.K.

goes by . . .

you could be keeping a check on it with this utility program by ROY PAGE

the display position you have entered. If this is correct, pressing Y will cause the time to be shown at this screen position.

Pressing N will take the program back to ask for another pair of coordinates so you can reposition the display.

To embody the Clock in one of your own programs, first include in your program Lines 40 to 80 (selection of mode may not be needed and if not line 50 can be discarded).

Then incorporate lines 200 to 300 in your program, located (and RENUMBERed) at any point where you wish to display the time. The procedures, of course, are added to the end of your program.

For those readers who are not familiar with the Electron program merging facilities, the Electron User Guide, chapter 28, pages 200 and 201 will provide further assistance.

Merging the Clock program into another program is probably best carried out as follows:

- Ensure that the Clock is saved on cassette at least twice. This is always a good idea in case the first save will not load. Then load Clock into your Electron.

- Using the direct command, DELETE 10, 190.

- Using the direct command, RENUMBER 20000 will renumber the procedure statements to a high starting point. When merged into your program, existing lines will not be overwritten by Clock.

- Ensure that the program into which you intend to merge Clock does not have line numbers greater than 19999. If it does, use a larger value for renumbering.

- With a separate cassette tape loaded into the tape recorder key in:

*SPOOL "TICK"

"Record then Return" will appear on the screen. Put the recorder into Record and, after ensuring the tape leader is past the record heads, press Return. This will stop the tape recorder (assuming your recorder has motor control).

- The command LIST followed by Return will cause the

program to be saved in Ascii format on to the tape. Then enter *SPOOL to close the spooled file.

- Load your own program and list it to ensure line numbers do not exceed 19999.

- Reload your cassette tape on to which you "spooled" Clock and rewind to the start

position. Give the command *EXEC "TICK". The Clock program will now be merged into your program.

- Lines up to and including 80 can now be retyped into the start of your program and the renumbered lines 200 to 300 can be put in your program where you need the time to be displayed.

KEYS

When the clock is running

Ctrl	Stops the clock display from updating the time.
Caps Lk	Restarts the display updating.
Delete	Stops the ticking sound.
Shift	Restarts the ticking sound.

This listing is included in this month's cassette tape offer. See order form on Page 47.

Make light work of listings

To save your fingers most of the listings in *Electron User* have been put on tape.

On the February 1985 tape:

CRAAL The mystifying maze adventure. **BOUNCY** Addictively annoying action. **PAIRS** Can you remember the cards? **BASE** A binary/hexadecimal conversion utility. **CATCHER** Collect the eggs before they break. **CLOCK** Time-keeping utility. **RACER** Grand Prix action. **NOTEBOOK** Graphics windows. **TRIG** All the right angles.

On the January 1985 tape:

SPACE BATTLE Destroy the deadly descending aliens! **NEW YEAR** A sound and graphics greeting. **ESCAPE FROM SCAROV** Minefield action. **PIE CHART** Statistics made simple. **CLAYPIGION** An Electron birdshot. **ORGAN** Music maestro please! **NOTEBOOK** An original program. **RANDOM NUMBERS** Or not so random! **SNAKES** Reptilian arcade action. **CHEESE RACE** Beat rival mice.

On the December 1984 tape:

CHRISTMAS BOX Align the presents logically. **SILLY SANTA** Sort out the muddle. **SNAP** Match the Xmas pictures. **RECOVERY** The Bad Program message tamed. **CAROL** Interrupt driven music. **AUTODATA** A program that grows and grows. **NOTEBOOK** Simple string handling.

On the November 1984 tape:

STAR FIGHTER Anti-alien missions. **SCROLLER** Wrap around machine code. **URBAN SPRAWL** Environmental action game. **SPELL** Alphabetic education. **JUMPER** Level headed action. **CAESAR** Code breaking broken. **KEYBOARD** Typing game.

On the October 1984 tape:

BREAKFREE Classic arcade action. **ALPHASWAP** A logic game to strain your brain. **SOUND GENERATOR** Tune the Electron's sound channels. **MULTI CHARACTER GENERATOR** Complex characters made simple. **RIGEL 8** Out of this world graphics. **MAYDAY** Help with your Morse code. **NOTEBOOK** Palindromes and string handling.

On the September 1984 tape:

HAUNTED HOUSE Arcade action in the spirit world. **SPLASH** A logic game for non-swimmers. **SHORT SHOWS** How sorting algorithms work. **SHORT TIME** The time they take. **CLASSROOM INVADERS** Multicoloured characters go to school. **SAILOR** Nautical antics. **MATHS TEST** Try out your mental powers.

On the August 1984 tape:

SANDCASTLE The Electron seaside outing. **KNOCKOUT** Bouncing balls batter brick walls. **PARACHUTE** Keep the skydivers dry. **LETTERS** Large letters for your screen. **SUPER-SPELL** Test your spelling. **ON YOUR BIKE** Pedal power comes to your Electron. **SCROLLER** Sliced strings slide sideways. **FLYING PIGS** Bacon on the wing.

On the July 1984 tape:

GOLF A day on the links with your Electron. **SOLITAIRE** The classic solo logic game. **TALL LETTERS** Large characters made simple. **BANK ACCOUNT** Keep track of your money. **CHARTIST** 3D graphs. **FORMULAE** Areas, volumes and angles.

On the June 1984 tape:

MONEY MAZE Avoid the ghosts to get the cash. **CODE BREAKER** A mastermind is needed to crack the code. **ALIEN** See little green men - the Electron way! **SETUP** Colour commands without tears. **CRYSTALS** Beautiful graphics. **LASER SHOOT OUT** An intergalactic shooting gallery. **SMILER** Have a nice day!

On the May 1984 tape:

RALLY DRIVER High speed car control. **SPACE PODS** More aliens to annihilate. **CODER** Secret messages made simple. **FRUIT MACHINE** Spin the wheels to win. **CHASER** Avoid your opponent to survive. **TIC-TAC-TOE** Electron noughts and crosses. **ELECTRON DRAUGHTSMAN** Create and save Electron masterpieces.

On the April 1984 tape:

SPACEHIKE A hopping arcade classic. **FRIEZE** Electron wallpaper. **PELICAN** Cross roads safely. **CHESTTIMER** Clock your moves. **ASTEROID** Space is a minefield. **LIMERICK** Automatic rhymes. **ROMAN** Numbers in the ancient way. **BUNNYGLITZ** The Easter program. **DOGDOG** The classic logic game.

On the March 1984 tape:

CHICKEN Let dangerous drivers test your nerve. **COFFEE** A tantalising word game from Down Under. **PARKY'S PERIL** Parky's lost in an invisible maze. **REACTION TIMER** How fast are you? **BRAINTEASER** A puzzling program. **COUNTER** Mental arithmetic can be fun! **PAPER, SCISSORS, STONE** Out-guess your Electron. **CHARACTER GENERATOR** Create shapes with this utility.

On the February 1984 tape:

NUMBER BALANCE Test your powers of mental arithmetic. **CALCULATOR** Make your Electron a calculator. **DOILIES** Multicoloured patterns galore. **TOWERS OF HANOI** The age old puzzle. **LUNAR LANDER** Test your skill as an astronaut. **POSITRON INVADERS** A version of the old arcade favourite.

On the introductory tape:

ANAGRAM Sort out the jumbled letters. **DOODLE** Multicoloured graphics. **EUROMAP** Test your geography. **KALEIDOSCOPE** Electron graphics run riot. **CAPITALS** New upper case letters. **ROCKET, WHEEL, CANDLE** Three fireworks programs. **BOMBER** Drop the bombs before you crash. **DUCK** Simple animation. **METEORS** Collisions in space.

HOW TO ORDER

The Kingdom of Craal

By MIKE BIBBY

FAR far way, beyond the Ice Mountains, lies the weird and wonderful Kingdom of Craal with its magnificent palace, crystal clear lake and enchanted forest.

It is a peaceful land, ruled for many happy years by King Meek who was respected by most of his subjects for his good nature and integrity — and his rather dishy, if inefficient, handmaiden Jut.

There was one character however who was not party to this overwhelming admiration — Vadham the evil wizard.

Many years ago, he was banished to the castle dun-

geons for trying to nick the king's gold plated penknife — the one with a special blade for taking stones out of horses' hooves.

In his spare time when he was not mixing spells or playing Gauntlet, he turned the dungeon into a labyrinth of despair, where only the brave had the courage to enter. Having said that, we haven't seen any of them come back yet.

You were born in Craal, the handsome son of a cobbler and many years ago you decided to seek a fortune in far off lands.

You returned many times to

visit your old mum and dad and spend the occasional happy hour in the company of the king's daughter Andrea.

What was once a childhood crush blossomed into love, and you have returned for good to claim your bride.

As on this last visit you found the king dead and the palace in uproar. The wizard had taken a heaven sent opportunity and, as the king opened the door down to the dungeons to let out the castle moggie, he grabbed his magnificent gold crown and disappeared into his hidey hole in

From Page 25

the depths — better than a penknife no doubt, but not much use for getting things out of horses' hooves.

You, in your typical youthful manner, were only interested in your future wife — Andrea. The palace guards, the footmen, the courtesans and even Ethel the cleaner, however, were not impressed with your infatuation and by a unanimous decision volunteered your services to retrieve the crown.

They threw you head-over-heels down the dungeon steps with a warning that should you return empty handed all your beloved possessions would be forfeit, even your subscription to *Electron User*. Some people stop at nothing.

Well, you have your challenge and you don't really have much option but to accept it.

In this serious adventure you have at your disposal six single letter commands. These are n, s, e, w, l and i — for the

four compass directions, plus look and inventory. Notice — they're all in lower case.

The program will also accept other standard adventure commands such as take, drop, hit and say. These words are intelligent, which means that if you have a key and want it in a lock, all you need to say is 'Drop key'. It will automatically go in the lock.

Now there's not much point in your typing in an adventure and finding, as you do, all the solutions within the listing. In order to conceal the clues therefore, I've written the important messages in code and they're all in the data statements at the end of the program.

There's nothing clever in what I've done, and I'm sure you'll soon spot that all the printed text has been offset by three letters. The sub-routine starting at line 510 decodes it all and turns it into sensible English in the finished product.

It is imperative that great

care is taken when entering these data lines if you are to enjoy the result of your toils.

Well, I think I've told you enough now. Any more hints and it wouldn't be much of an adventure, would it?

It only remains to wish you luck when you set out in your search for the crown — you're going to need it!

Turn to Page 54

The computer always has first go, but this is no real hardship, as it is unlikely to pick up a pair at its first attempt.

- Decides the level of play.
- Sets up certain variables, the user-defined characters and the one and only envelope used.
- Shuffles a pack of cards.
- Draws pack face down, and axes.
- Decides and executes the program's move.
- Displays scores.
- Determines the consequences of either player's move.
- Enters and executes the move of your choice.

PROCyourmove

Other sub-procedures are called from within these procedures during the course of a run, and these are briefly explained in REM statements in the program.

Your score (in games).
The program's score (in games).
The program's score (in pairs).
Your score (in pairs).
Contains the cards in a shuffled form. Cards are removed from this array during the course of a game, as they are picked up.
Contains an unshuffled pack of cards.
The program's memory, containing the cards and their positions on the playing surface. The extent of this memory is determined by:
Set during PROClevel).

MEMORY

The remaining variables are not included as they are either procedure-specific or flags used to see whether a specific event has occurred or not.

Find out in ALAN GORNALL's version of the classic card game

This listing is included in this month's cassette tape offer. See order form on Page 47.

Notebook

THIS month Notebook looks at the way VDU24 can be used to create a series of graphics windows.

Figure 1: Graphics window

10,20 The usual REM statements identifying the program.

30,40 Change the mode and switch off the flashing cursor.

50-70 A FOR...NEXT loop which repeats eight times using the control variable *swap*. Uses VDU19 to change the flashing colours (actual colour numbers 8 to 15) to steady colours.

80-120 A FOR...NEXT loop with control variable *colour* which cycles 15 times. Calculates the coordinates of the bottom left corner of the graphics window (see Figure 1).

100 Figures out the coordinates of the top right corner.

110 Calls PROCwindow, giving it the parameters in the brackets, which have been worked out in the previous two lines. Since these values depend on the value of *colour* they will be different each time round the loop. This means that fifteen different windows will be defined.

130 Calls PROCgrid which uses the graphics commands DRAW and MOVE to draw a grid.

140 This endless REPEAT...UNTIL loop just keeps the prompt (>) from reappearing.

150-190 PROCwindow
160 Defines a graphics window using VDU24. The following parameters define the position of its corners. Notice the semicolons between them.

170 Uses GCOLOR to redefine the background colour.

180 Has CLG clearing the graphics window to this new background colour. Notice that only the present window is affected.

200-300 PROCgrid. This uses the by now familiar MOVE and DRAW commands to put a black grid on the screen. Notice that while the coordinates seem to cover the whole screen with lines, only the part inside the final graphics window appears.

loops 15 times calculating coordinates

Defines window

Chooses black

Swaps steady colours for flashing ones

Calls final procedure

Sets background colour

Draw vertical lines

Draw horizontal lines

```

You're never too young to play a Magical Adventure on the BBC Micro or Electron!

Based on the style of the classic computer adventures – but written so that even small children can learn to find their way around, encouraged by colourful graphics and exciting sound effects.

The pack contains a 48-page full colour storybook
PLUS
a full length multi-location adventure on cassette
for only

£8.95! post free

Read the book
– then play
the game!

Makes
an ideal
present

Please send me the complete Magic Sword pack containing storybook and cassette to:

Join in the farmyard fun!

... and have a smashing time in this eggstra special game by **ROLAND WADDILOVE**

OLD farmer Brown has been having a spot of trouble with his chickens lately - they just will not stay still while he collects the eggs.

The birds fly to and fro, the eggs ending up everywhere.

Can you help him catch the eggs as they drop?

If you manage to catch 50 or more before the chicken reaches the bottom you move on to the next level, where everything moves faster.

PROCEDURES

PROCstart

Prints the message if it is not the first screen. Sets the level, eggs and delay. Draws the ground, man and bird. Sets the start positions. Defines the envelope and characters for the egg and ground. Sets the level, score and eggs to their initial values.

PROCinitialise

Assembles a short machine code routine to move the eggs, man and bird.

PROCman

Checks if keys are pressed, calls code to move the man. Moves the chicken to the right. If at the end of the line, move to the start of the next.

PROCbird

If there is an egg then calls the code to move it. Erases it if it is at the bottom.

PROCEgg

Prints the final score and asks if you want to play again.

PROCanother

PROCinstructions

Prints the instructions.

VARIABLES

T%

Time delay.

E%

Eggs collected.

level

Level.

S%

Score.

X%,Y%

Chicken's coordinates.

Z%

Man's coordinates.

I%,J%

Loop counters.

C%,D%

Pointer to coordinates of eggs.

mm

Address of code to move man.

mb

Address of code to move bird.

me

Address of code to move eggs.

```

Sum way to rescue a damsel!

HAVE you ever fancied yourself as a handsome prince, rescuing a damsel in distress from the castle where she's imprisoned?

ANDREW GARDINER'S

program, Education Castle, lets you find out just how successful you would be.

Can you answer the questions correctly and reach the top of the steps? Or are you bad at sums and due for a ducking?

Either way it's a great way to practice simple sums.

Now all we need is a game about frogs and princesses...

EPIC ADVENTURES...EPIC ADVENTURES...EPIC ADVENTURES...EPIC ADVENTURES...EPIC ADVENTURES

The Definitive Adventures for the Electron...

"Having now tried all the Epic Adventures, they must be the yardstick by which all other adventures for the Electron should be judged."

ELECTRON USER

"The Wheel of Fortune for the BBC and Electron is a highly-recommended state-of-the-art adventure."

SHIELDS GAZETTE

"This has to be the adventure of 1984. It really is superb."

MICRONET 800

"The definitive adventure. Highly recommended."

ELECTRON USER

Our other three adventures have also received superb reviews in Electron User. They each contain approximately 230 locations and 25,000 characters of text.

The Wheel of Fortune

This game is a classic puzzle adventure with all the features you'd expect from EPIC...

PLUS

- Intelligent moving characters with varying moods. And you can talk to them too!
- Multistatement language and speech interpreters.
- Runs in real time.
- 250 locations and over 30,000 characters of text. Only Epic's compression techniques can pack so much into the Electron.

GOIN' FASTER THAN A ROLLER COASTER

COASTER is a short graphics routine which runs in Mode 1, drawing a spiral which curves in three dimensions.

Next it gives the impression of movement, creating what looks like a moving conveyor belt or roller coaster.

Lines 40 to 150 draw the spiral. They do this by drawing a damped cosine curve 20 times across the screen.

Each curve is drawn a few pixels to the right of the previous one. The size of the oscillations decreases as the waveform proceeds.

The curve is drawn in three colours - white, yellow and red - on a black background.

It gives a picture that looks like a striped football scarf.

The final section of the program - lines 160 to 220 - consists of a continuous

loop which uses the VDU 19 command to animate the image.

As the program stands, the roller coaster effect uses red and white colours. This can easily be changed by altering the relevant lines.

For example, for a blue and cyan roller coaster, make the following alterations:

```
180 VDU 19,E,6;0;
200 VDU 19,E,4;0;
```

Using green and white or black and yellow also produces quite effective displays.

```

Get yourself taken for a ride
with JON WILLINGTON's
clever graphics routine

Just what you've been waiting for!

Contains
32 page
booklet
giving clear,
easy-to-follow
instructions on
all 4 programs

★ Word Processor ★ Graphics
★ Spreadsheet ★ Database

Now they're all together -in ONE simple package

Word Processor: Ideal for writing letters and reports. There is a constant display of both time and word count, plus a words-per-minute display to encourage the budding typist! A unique feature is the double-size text option in both edit and printer mode – perfect for young children and people with poor vision.

Spreadsheet: Enables you to use your micro for home accounts or pocket money records. It creates a display of numbers in rows and columns. Continuous updating is possible, and a changed figure can be instantly reflected throughout the rest of the spreadsheet. Your results can be saved, to be used for future updates,

or can be fed into its associated program...

Graphics: Part of the spreadsheet section, it lets you draw bar charts, pie charts and histograms to give a graphic presentation of your figures.

Database: You use this for storing information, just like an office filing cabinet. Facts you have entered can be quickly retrieved by just keying in a word or part of a word. They can be sorted, replaced, saved for future use or printed out.

If you want to start doing more with your micro than just playing games, this package is your ideal introduction to the four most popular applications for professional computers. All the programs have been designed for simplicity, so even a child can use them. Easy, fully-detailed instructions are included.

Send your programs to
Scrapbook, *Electron*
User, 68 Chester Road,
Hazel Grove, Stockport
SK7 5NY.

SCRAPBOOK is the feature that contains a selection of all the short, simple programs sent in by our readers.

It's where we keep a record—our scrapbook—of all the interesting little routines that don't end up in the Notebook or in Program Probe but are too good for us not to share.

This month it's very much a graphics show. Next month—who knows? It's up to you.

So if you enjoy messing about with your Electron and want to share your discoveries with other Electron users, send them in to us.

BE A RACE ACE

RACER gives you all the thrill of the race track as you use your Electron's keyboard to drive around the circuit.

The idea is to steer your car using the Z and X keys to go left and right respectively.

You gain points as you speed along, but you also lose them should you hit any of the white bollards that mark the track.

Also there are cars

coming towards you that you must avoid at all cost. Hit these head-on and you'll lose more points.

As if this isn't enough there are nine levels of play, with the track becoming longer and narrower on each level.

When you reach the finish the Electron will tell you your score and compare it with the high score.

Then it's off on the road again.

BOOK SHELF

First principles of graphics and sound

Electron Graphics and Sound by Steve Money (Granada).

THE Electron programmer has quite an extensive list of graphics and sound commands at his fingertips. The number and variety of these can be quite bewildering to the newcomer.

The aim of this book is to explain the basic principles involved in producing interesting graphic displays and sounds.

The emphasis is more on useful routines than games programs, and many of the procedures could be used in your own programs.

The reader is taken from

first principles – drawing a line and plotting a point – to the quite complex procedure of

producing a perspective view of a wire frame object. All is explained in a clear and concise manner.

The sound section is not as good as the graphics. The author seems unaware that the Electron can only use one sound channel at a time and actually lists a program to play a series of notes on two channels simultaneously.

It was obviously written on a BBC Micro and sounds more like a rude noise on the Electron.

However I can recommend this book to anyone interested in producing lively graphic displays. But take the sound section with a pinch of salt.

Roland Waddilove

Open up a new world

Electron Machine Code for Beginners by Ian Sinclair (Granada).

EVER been frustrated with sluggish Basic – fed up of waiting for your program to catch up?

Although the Electron uses BBC Basic, arguably the best and fastest around, it's not much good for smooth animation effects or efficient utilities as it's too slow and it occupies too much memory.

The simple answer is machine code, the language of the micro's processor. Unlike Basic, it doesn't have to be translated by the micro as it runs.

However machine code is just a series of meaningless numbers, so the simple answer is assembly language.

As the Electron already has an assembler on-board, all you need is a fair knowledge of Basic – and Ian Sinclair's book.

The text deals with

everything from ROM and RAM to bits and bytes. It assumes no prior knowledge of assembly language, and explains the inner workings of the micro and the possibilities of assembly.

The later chapters cover the methods and principles involved in an example assembly listing, with all mathematical

processes being kept in separate appendices at the back where they are easily found – or ignored.

Also included is a major section on checking and debugging assembly programs, as well as several pages about a machine code monitor – perhaps a little premature for beginners.

The book is well thought out and, apart from a few mistakes, well written.

I have one minor complaint about the layout. A vital section on saving and loading programs was placed in the middle of another chapter about data in assembly programs. Surely this would have been better as a separate chapter or appendix?

However, this is an excellent and easy to understand introduction to the art of machine code programming which will open up whole new fields of program writing.

Andrew Oldham

Valuable, but slow

Instant Arcade Games for the Electron by Jean Frost (Pan).

THIS has been written for people with little programming knowledge to help them create their own arcade games. There is also a listing for an adventure game and character generator.

The main control loop for an arcade game is listed. After typing this in you enter the procedures used.

Here you have a choice of several different versions of each procedure, all with the same line numbers and all of which work with the main control loop.

There are seven different backgrounds, 13 different aliens, 15 different players and various checking and scoring routines. You just choose which one you want and type it in.

As you can imagine quite a large variety of games can be produced. The games look quite reasonable, but are incredibly slow.

I fell asleep three times playing the example! This is a simple space invader type of game with just one invader. It takes well over a minute for your laser base to crawl from one side of the screen to the other.

The book is valuable in that it teaches how to structure games programs, explaining every procedure in detail, but the arcade type games themselves are not really playable as they are so slow.

A reasonably good programming book, but not suitable if you want to play some fast arcade games.

Roland Waddilove

NICE & EASY

ARE you confused between binary and decimal? Do you find you don't have enough fingers to count in hexadecimal? Do you go cold when you see a & in front of a number?

Never fear, because MARK FENTON has come to your aid with his intriguing

utility Base.

It's completely menu-driven and couldn't be easier to use.

Just tell your Electron which conversion you want, enter the number and the program does the rest.

It's as easy as ABC. Or is it &ABC?

PROCEDURES

PROCinit

Sets up variables and shows instructions.

PROCdisplay

Sets up main menu.

PROCact_on_it

Acts on user's choice.

PROCBi_to_dec

Changes binary to decimal.

PROCFill_in

"Pads out" binary numbers with leading zeros to make eight bits.

PROCBi_dec_work

Works out binary to decimal conversion.

PROCBi_to_hex

Changes binary to hex.

PROCdec_to_hex

Changes decimal numbers to hex.

PROCdec_to_bi

Gives binary representation of a decimal number.

PROCdec_to_bi_work

Calculates decimal to binary conversion.

PROChex_to_dec

Displays hex numbers as decimals.

PROChex_to_bi

Shows hex number in eight bit binary.

PROCcon

Turns cursor on.

PROCoff

Turns cursor off.

FNanother_go

Asks for another go.

PROCchoice

Takes user's choice from main menu.

PROCassemble

Assembles machine code for double height routine.

PROCdbl

Uses machine code to produce double height letters.

FNcheck_binary

Checks for a correct binary number.

FNcheck_hex

Validates hex input.

FNcheck_decimal

Validates decimal number input.

PROC_B_R_E_A_K

Restores program after Break has been pressed.

electron

user

Be one of the first to get each issue

A subscription will ensure you get your own personal copy **HOT OFF THE PRESSES** month after month for the next year.

Every owner of an Electron — and everyone thinking of buying one — needs to get *Electron User* every month. It's the brightest, most authoritative yet completely independent guide to a machine that has so much potential you will never tire of reading about its remarkable capabilities.

You can buy *Electron User* from your local newsagent or station bookstall. Or you can take out a 12 months subscription and have it delivered to you by post.

Your Electron needs protecting!

Protect your *Electron* with our luxury dust cover made of soft pliable water-resistant vinyl, bound with strong cotton and decorated with *Electron User* logo.

£3.95

Keep your collection of *Electron User* complete with these handsome binders

Bound in attractive red pvc with the *Electron User* logo in gold blocking on the spine, this binder will hold 12 magazines firmly secured in place by metal rods. **£3.95**

FREE

**Cassette worth
£3.75 if you
subscribe NOW!**

If you take out a subscription to *Electron User* now you will receive completely free one of the monthly cassettes of *Electron User* listings. Choose which one you want from those illustrated below.

This free gift is for a limited period, so subscribe now!

Cassette tapes of Electron User programs

Save typing in programs from *Electron User* by sending for these program-packed tapes.

**ONLY
£3.75
each**

You can also take out a subscription for the 12 monthly tapes for £40.

IAN RODGERS
adds a whole
new meaning
to the term
'flow chart'

HOT Water makes use of the Electron's graphics commands to produce a coloured diagram of a domestic hot water system. It's simple yet effective, showing the Electron's design potential.

And we doubt whether it will stop at Hot Water. Here at *Electron User* we've noticed that a program we feature one month sparks off lots of ideas for other ones.

We wonder what will follow next. A diagram of a steam engine or a car piston? Maybe an animated electrical circuit diagram? You'd better send us some, or you'll be in hot water!

**Get
your diagrams
on tap**

'EXCELLENT' thoroughly recommended'

D.P. Publications have built up a reputation for low priced high quality products. Don't miss two exciting new products which could be ideal for YOU!!!

Electron and BBC BASIC, Quick Reference Guide for Programmers (154 pages)

This guide brings to your attention the vast array of superb programming facilities available and should prove an invaluable aid to any programmer whether beginner or experienced, in producing better programs more quickly.

The review in the October issue of 'ELECTRON USER' said:-

"... It's cheap, but it's also excellent. What you get for your money is an alphabetical guide to over 200 reserved words and operating system commands. Elaborating on these are some extremely useful example programs and a brief note on the differences between the BBC Micro and the Electron. The main part of the book is taken up with the directory of keywords - and what a treasure trove it is... lucid, thorough and surprisingly readable... thoroughly recommended".

Data Structures Demonstrator - Cassette (55k of programs) and Workbook (93 pages)

This coordinated package of cassette plus workbook runs on either the BBC or the Electron. If you are writing programs which need to have data added, deleted, or retrieved then this package should be a must. You are not alone in finding it difficult to imagine how your computer handles Data Structures (Linked lists; Hash tables; Binary trees etc). Our programs make it visible and the workbook provides exercises to ensure you can more quickly understand and then use Data Structures.

"It looks very useful"; It should help a lot of students grasp the concepts more readily"; "My students think it's fantastic" (Lecturers comments).

Prices include postage and packing. Send cheque postal order to:

D.P. Publications Ltd,

ELECTRON, BBC Model B
(any OS, BASIC I/II)

QUAL-SOFT

£9.95
(inc. VAT and p.p.)

"There is one fault though. I am going to lose a lot of sleep over it, it is so addictive". Steven Wiseman of Liverpool.
"Many thanks for the fantastic game. As soon as I received it, there was no stopping until the end of the season". J. Hooley of Twickenham.
"I am writing to say what a wonderful football program SOCCER SUPREMO is. It really is the best football game on the market at the moment". Anthony Hayes of Redcar.

"SOCCER SUPREMO"

NOT SO MUCH A GAME, MORE A WAY OF LIFE!

You have just been appointed Manager of a newly promoted 1st Division Club, and it is up to you to transform this very ordinary side into one that can realistically challenge for the 1st Division Championship within the next 5 seasons. You must assess your side's capabilities and then, through your youth policy and the transfer market, reinforce the strengths and eliminate the weaknesses. It's all so easy ... or is it?

***"3-D", 22 MAN, FULL PITCH, FULL MATCH GRAPHICS SIMULATION

- 42 match season, 21 home games, 21 away games.
- Transfer market (Rush, Robson, Hoddle etc).
- 4-4-2, 4-3-3 and 4-2-4 team formation.
- In match tactical adjustments.
- Opposition skills related to League record.
- Opposition: 21 of the current 22 Div 1 sides
- Match injuries: Your physio reports
- Team selection by names, (enter initials)
- Home/away bias, opposition tactical play
- Tactical substitutions

And many more features, but will take a full page advert if we are to continue, (That'll be O.K. Ad. Man).

The game will be posted on the same day as the receipt of order. ACCESS telephone authorisations should take no more than two days to arrive.

BBC/ELECTRON PROFESSIONAL SOFTWARE

Our educational software is used in thousands of schools and homes throughout Great Britain.

EDUCATIONAL 1 BBC/ELECTRON Tape £8.00 Disc £10.00
Hours of fun and learning for children aged five to nine years. Animated graphics will encourage children to enjoy counting, maths, spelling and telling the time. The tape includes six programs: MATH 1, MATH 2, CUBECOUNT, SHAPE, SPELL and CLDCK.
An excellent mixture of games Personal Software Autumn 1983.

EDUCATIONAL 2 BBC/ELECTRON Tape £8.00 Disc £10.00
Although similar to Educational 1 this tape is more advanced and aimed at eleven to twelve year olds. The tape includes MATH 1, MATH 2, AREA, MEMORY, CUBECOUNT and SPELL.

FUN WITH NUMBERS BBC/ELECTRON Tape £8.00 Disc £10.00
These programs will teach and test basic counting, addition and subtraction skills for four to seven year olds. The tape includes COUNTING, ADDING, SUBTRACTION and an arcade type game called ROCKET MATHS which will exercise addition and subtraction. With sound and visual effects.

These are excellent programs which teachers on the project have no hesitation in recommending to other teachers. Computers in Classroom Project

FUN WITH WORDS BBC/ELECTRON Tape £8.00 Disc £10.00
Start your fun with alphabet puzzle, continue your play with VOWELS, learn the difference between THERE and THEIR, have games with SUFFIXES and reward yourself with a game of HANGMAN.
Very good indeed A&B Computing - Jan/Feb 1984

JIGSAW AND SLIDING PUZZLES by P. Walker BBC/ELECTRON Tape £7.95 Disc £9.95
There are two jigsaw and four sliding puzzles on a 3 x 3 and 4 x 4 grid. Each program starts off at an easy level to ensure initial success but gradually becomes harder. It helps children to develop spatial imagination and in solving problems. The tape includes DBLONG, JIGSAW, HOUSE, NUMBERS, CLOWN and LETTERS.

KON-TIKI by A. Amos BBC Tape £12.95 Disc £14.95
Simulation program based on Thor Heyerdahl's KON-TIKI expedition. Enjoy a journey on the KON-TIKI recording on a map the raft's position and entering notes in the logbook on creatures found, unusual events etc. Inclusive of booklet, background information, maps and fully supportive illustrated data sheets.

'IMAGE' V.2 - FOR THE ELECTRON/BBC

'Image' was the ultimate tape back-up copier, now it's even better

You can be completely assured that this is the best and most able program of its type available. It can deal with:

- Locked programs
- Programs of any length
- 300 and 1200 BAUD
- Files
- ?'s (Ctrl codes) in filename
- Multiple copies
- False or trick block info.
- Changing filename
- Continuous data streams
- Locking and unlocking programs

It is VERY IMPORTANT INDEED purchasers take note that 'IMAGE' is for sale strictly for making BACK-UPS of your own software for your own use, for protecting your own programs, or as an aid to putting software on disk. Any person found using the program for illegal purposes runs the risk of being prosecuted.

To receive your copy of 'Image', send a cheque or P.O. to the sum of **An Astonishing £4.80** to:

PETER DONN, Dept. (EU),

33 Little Gaynes Lane, Upminster, Essex RM14 2JR.

Please state BBC or Electron version.

V.1 owners can obtain V.2 by sending £1.50 + V.1 without case.

STRIPPER II

The professional tape back-up copier for the BBC/Electron, the best around!

This copier, which has been selling for over a year for use on the BBC, is updated regularly to ensure you can make security back-ups of all your own commercial software.

As Stripper II is so good we must insist on personal use only, please. Copies admirably with locking, false addresses, control code filenames, long programs, in fact any protection you will find on your latest software releases. It even lets you put locking protection on your own programs.

New low price, just **£3.95** cheque or P.O. to receive Stripper II by return post. Educational orders welcome.

FREE OFFER - when Stripper III is released, owners of Stripper II can return the voucher sent to them and get the new version absolutely free!

Orders to:

**Aggressive Software, 14 Elmore Road,
Sheffield S10 1BY**

Micro Messages

HELP! Take pity on an inexperienced, eager adventurer!

I have had my Electron for a couple of months now and I am learning all the time, but one thing I cannot master is adventures or to be precise one adventure (I've only tried one!).

Having had a go at an adventure of my cousin's I thought that adventures were fun (though obviously not easy) and I decided on getting one. The one I chose was Program Power's Adventure.

Trouble is I cannot seem to get very far with it, in fact I have come to a dead end.

I have searched the forests (and got lost) and the cavern (by typing in "Open Sesame") but that's it, I seem to have been everywhere, but I know I have not, so where to now?

I have picked up a scarf, a lamp, a green frog (which when killed turns into a princess and runs away, but the princess cannot be followed!), a wicker cage, a glass slipper and oil.

The computer does not understand WAVE so I have tried rubbing everything but the answer is NOTHING HAPPENS, except on the lamp where the answer is NOTHING HAPPENS HERE, which I suspect means: 'nothing will happen here but it might elsewhere'. Am I right?

By the way, I have occasionally found the axe in the forest but I am not always successful.

So please, please, please help me on my way. I just want you to help me to get to the next stage, find the next place to go, please help me Merlin, I

Help! Take pity on a poor adventurer

am thinking of chucking the game out! — **Jenny Tremlett, Tadworth, Surrey.**

● Merlin will be notified, Jenny.

Complete recovery

MANY thanks for Dave Robinson's superb Recover program. (Electron User, December). As a person prone to taping over the end of saved programs I was delighted to find that this program could bring back what was left of it and the program could be resurrected.

It came in very useful only today when I taped over the end of the Xmas Carol program, which I am using as part of a compilation of programs I'm sending to a friend instead of a Christmas card. — **Graham McCann, Callander, Perthshire.**

Joy — what joy?

WITH reference to Micro Messages in the August edition of Electron User — "Joy for First Byte interface owners ... can now use it with all Acornsoft games..." This is

just not so!

It will not work with Chess, Draughts, Reversi and so on, in fact any game relying upon operation by the use of two coordinates to indicate a particular spot on the screen.

Can any genius suggest a procedure that will so operate? — **J. Clewson, Stauton.**

● None of our resident geni can come up with a program that would work for every occasion. Over to the readers.

Turning to the Electron

YOU recently reviewed a copy of Practical Programs for the Electron by the Bishops, but have you seen the cover?

Among the letters and numbers there is distinctly **DIVIDE ÷ SIGN!**

Surely everyone who uses a computer knows that there is no such sign, just a / for divide.

Having ordered all the back-copies of Electron User I have watched with interest the correspondence about not being able to get the top line of text on television screens.

Readers may be interested to hear my experience.

I recently bought a Philips 2006 and was very disappointed when I too lost the top line, but I contacted an engineer who adjusted the set with no trouble.

He dropped the picture area down low enough to get the top line on, without showing the teletext lines when used normally.

It may be that more people can do this without resorting to programming techniques?

Electron User seems to be

growing up faster, especially by including a review of the Mushroom-Printer/User port add-on.

I could not afford a BBC and decided on the Electron, but regret not having any interfacing facilities.

This interface gives the chance of having the user-port and allowing the computer to control something.

I bought Bruce Smith's book but I must admit, I find it very difficult to follow.

I work in research, and several colleagues who have family financial restrictions are turning to and buying the Electron.

We are not games players and want to learn serious programming and start doing some interfacing.

I write to ask if you would start a series on "Interfacing with the Electron", using say, the user port as the Mushroom unit.

This may give the more technically minded user a new insight into what the Electron can do. — **C.M. Hawkes, Runcorn, Cheshire.**

● We hope to start an interfacing series soon, but it would be based on the Plus 1 interface.

Get down to training

RECENTLY I spent one week's holiday at my cousin's, who owns a BBC Micro. One of the programs which he showed me was one which just played well known tunes.

Maybe you could show how this is done — translating written or staved music, into

WHAT would you like to see in future issues of Electron User?

What tips have you picked up that could help other readers?

Now's here is your opportunity to share your experiences.

Remember that these are the pages that you write yourselves. So

tear yourself away from your Electron keyboard and drop us a line.

The address is:
**Micro Messages
Electron User
Europa House
63 Chester Road
Hazel Grove
Stockport
SK7 5NY.**

Micro Messages

From Page 61

sound commands? It could appear in your "noise and music" feature.

Finally, in your request on *Micro Olympics*, I am doing quite abysmally. My best event is the javelin, in which I have thrown 87.95m.

I have beaten my computer at the 100m, three times, but literally given up at the 1500m.

I'm pathetic at all the jumps, especially the long jump (I'm not telling my best).

I think it is an original game, but isn't there a better way of controlling the man than banging the keys? I must admit, I can't think of one. — **A. Manning, Huddersfield, Yorks.**

● It is impossible to do well at the Olympics if you "bang" the keys. Use finger rather than wrist movement and quickly tap the keys. Using this method, the world record can be beaten in all events.

As with the real Olympics, plenty of training is necessary. Good luck.

A jump too far

I RECENTLY received a First Byte joystick interface and a Quikshot II joystick. I found playing games much, much easier but I later discovered that *Micro Olympics* is not convertible.

Can you convert the program by any other means rather than using the conversion tape? If so how?

By the way, *Micro Olympics* is a brilliant game, but is it actually possible to beat the computer at the long jump? I have tried time and time again, but without success. — **Liam Ruddock (aged 12).**

● *Micro Olympics* is not designed to be used with joysticks, because as they are all different it would have been impossible to set a standard for them.

If you run fast enough the long jump (and all the other events) are possible.

Don't miss out!

HAVING missed the December edition of *Electron User*, I think you should print the date of publication for the coming edition, as those of us with sieve-like memories forget to subscribe. — **Jonathan Mercer, South Woodham ferrers.**

● You don't know what you missed! But you can make sure it doesn't happen again by turning to Page 47.

High-score plea

I MUST say how grateful I am to *Electron User*. It has helped my programming methods to improve greatly. The magazine caters for those who do not have an 'O' level in BBC Basic!

The VDU characters are great but could you tell me what happened to them in the December issue, I am mystified.

After reading the *Claim to Fame* by David Thompson in *Micro Messages* in December issue, it has come to my attention that a high-score table would be a great idea.

I'm sure there's hundreds more that agree with Dave and I. Please, please add another PAGE!

I can't really boast about my

high-scores but at least it's a start.

Chuckie Egg336,400
Felix Factory.....14,300
Croaker.....14,360
Pengl.....68,000
Twin Kingdom
Valley completed...1,024
Starship Command...480

How about using screen photographs as proof of high score? — **No name, but address in Bridlington, East Yorks.**

Marks out of ten

I MUST tell you of the excellent service I have received since I bought my *Electron* in August.

I bought it from *Micro Power*. I paid the standard price of £199, but also received a cassette recorder. The package was delivered in only 36 hours.

However, I found that the cassette player was faulty. I returned it, and received a replacement in only five days. I would recommend *Micro Power* to anyone.

I also purchased a game by Durell Software called *Mine-shaft* — the game is superb, please review it — from a shop in Gloucestershire.

I had difficulty loading it and returned it to Durell. I received a replacement also in five days. I would like to thank the company for their excellent

service.

Could you please give marks out of 10 for each game for, say, graphics, sound and so on and include the price in your reviews?

Keep up the good work! — **Nigel Jacques, Loughborough, Leics.**

● The trouble with a score table is that it's very hard to get standardisation on the scores. One man's 10 would be another's 5 and so on. We feel it's better to get a general assessment of the game.

To change the subject, it's nice to hear of good service. All we usually hear about are the complaints.

Elite warning

A GRIM warning to future buyers of *Elite* for the *Electron* who have seen it on the BBC *Micro* and read the reviews.

It is not quite the same on the *Electron*.

I found that after saving my credits, where I bought my *Galactic Hyperdrive*, I could not use it.

There is no colour, less enemy ships and it's drastic flashing.

Acornsoft's spokesperson said: "There are no plans at the moment to debug the program as the faults do not interfere with the playing of the game".

— **D. Fiveash, Tolworth, Surrey.**

Comments from afar..

GREETINGS from Swaziland. First let me congratulate you all for a most useful magazine which really does assist the first-timer, and especially those of us who are a little longer in the tooth.

I bought my *Electron* after the delivery hoo-ha in April this year and on my return to Swaziland I decided to buy in all copies of your magazine — a most wise decision which has allowed me to follow feature articles in sequence as a

training course.

Now for one or two comments. Could your book reviewers please give fuller details, such as the name of the publisher and the ISBN?

There are no well-known booksellers in the High Street here in which to browse and by the time *Books in Print* catches up with a title the details have been forgotten.

As to your listings — yes, they do cause problems from time to time, although they are

better than other magazine listings I have seen.

Needless to say, more, and yet more, educational programs would be my suggestions for the future.

May I close by also thanking you for the prompt delivery service — I may be 7,000 miles away, but the December issue has been thoroughly enjoyed.

My good wishes to all your staff. — **W.L. Roberts, Mbabane, Swaziland.**

ARCADE, STRATEGY & ADVENTURE FOR BBC & ELECTRON

WARP 1...command a federation starship...seek out a fellow space captain who is lost in space and boldly go where no man has gone before.

"It's like no other game I've played before...screen layout is excellent...it's different!" Electron User.
"Stylish graphics and a splendid hyper-space display" Pop Game Weekly

BBC £7.95 Electron £7.95
